

No Windrows From Grading

Using the TerraBond[®] Spreader Grader[™] unit can eliminate the need to make multiple passes to remove and spread windrows. The unique feature of a flow through, mix zone and skid pan enclosure with the Spreader Grader[™] eliminate windrows.

Road Grader = Windrow: The typical motor grader method of grading dirt or gravel roads moves dirt and gravel across the grader blade and depositing it in a windrow pile in the middle of roadway. Besides requiring a second and perhaps third pass to reshape the road, grass and low quality soil are removed from the shoulder and deposited in the driving path of the roadway.

Spreader Grader[™] = No Windrow: Unlike motorized road graders, Spreader Grader[™] units use the power of a tractor to pull through the road's surface. Rather than rolling or moving dirt from the shoulder onto the roadway, Spreader Grader recycles dirt and gravel in place. Road material is spread along the surface without creating any windrow effect. This eliminates the need to make multiple passes to get the job done.
